

# Business Intelligence from a Cloud Hosted Platform

## Business Intelligence ("BI")

BI is the ability to produce information for an end user about their activities, allowing them to make business decisions based on current and historical information.

With a cloud-based solution individual retail locations are able to continuously exchange information with central offices, providing organizations real-time information to significantly improve their cash management and control processes. By having data immediately available across Operations, Finance, Loss Prevention and Human Resources, companies are able to move from a reactive to a proactive posture when dealing with out-of-compliance cash handling behavior.

BI is "User Defined" considering:

### FORMAT

Allows the user to determine his/her data structure (dashboard, raw data, etc...)

### CONTENT

Allows the user to see only data which is relevant to his/her function (Risk Reporting, Treasury Reporting, HR Reporting).

### SCHEDULE

Allows data to be sent on a fixed schedule or on-demand.
